

Tutorial 5

Dataset: studentsMark.csv

1. Section A: Data Preparation

- a) **Separate the target column Result from the feature columns.**
This will be used as the label for model training.
- b) **Split the dataset** into training and test sets using **35% as test size**.

2. Section B: Model Building and Evaluation

- a) **Train a Logistic Regression model** using the training set.
Tune any **two hyperparameters** to improve the model's performance.
- b) **Train a Decision Tree classifier** and tune **two hyperparameters**.
- c) **Evaluate both models** using **recall** and **F1-score on the test set only**.
- d) **Compare the two models** and decide which one performs better.
Justify your answer based on metric values and explain which model is more suitable for this case.
